

Differential pressure transmitters for critical VAC applications and flow velocity measurement

testo 6351

hPa

m/s

Measurement of differential pressure, flow velocity and volume flow

Automatic zero-point adjustment guarantees high, temperature-independent accuracy and long-term stability

Display with multi-language operating menu and optical alarm display

Ethernet, relay and analog outputs allow optimum integration into individual automation systems

The P2A software for parameterization, adjustment and analysis saves time and costs in commissioning and maintenance

Configurable alarm management with adjustable response delay

The differential pressure transmitter testo 6351 was developed specially for monitoring differential pressure in the measuring range from 50 Pa to 2000 hPa. For this reason, it is suitable for monitoring cleanrooms as well as for demanding VAC monitoring. In addition to this, the flow velocity or the volume flow can be calculated from the measurement of the differential pressure in a Pitot tube.

The automatic zero point adjustment ensures highest accuracy and long-term stability.

*The determination of measurement uncertainty takes place according to GUM (Guide to the Expression of Uncertainty in Measurement):

For the determination of measurement uncertainty, the accuracy of the measuring instrument (hysteresis, linearity, reproducibility), the uncertainty contribution of the test site as well as the uncertainty of the adjustment site (works calibration) are taken into account. For this purpose, the value of k=2 of the extension factor, which is usual in measurement technology is used as a basis, which corresponds to a trust level of 95%.

Measurement uncertainty differential pressure ±0.8% of measuring range final value ±0.3 Pa
